

Notes on upgrading to Gnuradio 3.7

July 21, 2013

Tom McDermott, N5EG

The Gnuradio installation script for GRC3.7 does not remove previous versions of Gnuradio. Due to changes between GRC3.6 and GRC3.7, some of the old libraries are left installed on the computer. These unfortunately are not compatible, and prevent proper operation of GRC3.7.

In order to install GRC3.7, you must first remove all of the old libraries. A Bash script is in the GRC3.7 folder called

Gnuradio_remove

Execute this file from a command prompt. Assuming you are at the <~> directory and the script file is located in that directory, the command would be:

```
~ $ sudo bash Gnuradio_remove
```

This will remove almost all of Gnuradio.

Then use the wget command from the Gnuradio website to install the latest version.

Note: once the older version is gone, there is no easy way to reinstall it.
